A complex number is a number of the form $a + bi$, where a and b are real numbers, and i is an indeterminate satisfying $i^2 = -1$. For example, $2 + 3i$ is a complex number. This way, a complex number is defined as a polynomial with real coefficients in the single indeterminate i , for which the relation $i^2 + 1 = 0$ is imposed. Based on this definition, complex numbers can be

Analytic functions of several variables have some of the same properties as analytic functions of one variable. However, especially for complex analytic functions, new and interesting phenomena show up in 2 or more complex dimensions: Zero sets of complex analytic functions in more than one variable are never discrete.

Conformal mapping is extremely important in complex analysis, as well as in many areas of physics and engineering. A mapping that preserves the magnitude of angles, but not their orientation is called an isogonal mapping (Churchill and Brown 1990, p. 241). Several conformal transformations of regular grids are illustrated in the first figure above.
