This notion is studied from a) the homological point of view: construction of the (co)homology theory with trivial coefficients and general coefficients, b) the operadic point of view: determination of the dual operad, that is the dendriform dialgebras which are strongly related with the planar binary trees, c) the algebraic point of view: Hopf structure and Milnor-Moore type theorem.

The principal result about this homology theory is its vanishing on free associative dialgebras. The Koszul dual (in the sense of Ginzburg and Kapranov) of the operad of associative dialgebras is the operad of "dendriform algebras". The dendriform algebras are characterized by two operations satisfying three linear conditions.

THE POLYDENDRIFORM OPERAD AND RELATED OPERADS SAMUELE GIRAUDO Abstract. Dendriform algebras form a category of algebras recently introduced by Loday. A dendriform algebra is a vector space endowed with two nonassociative binary operations satisfying some relations. Any dendriform algebra is an algebra over the dendriform op-

became clear that dendriform dialgebras are an interesting subject on its own. This can be seen on one hand by its quite extensive study by several authors in areas related to operads [25], homology [10, 11], combinatorics [2, 3, 9, 28], arithmetic [24], quantum field theory [9] and especially Hopf algebras [2, 5, 15, 30, 36]. The operads  $\text{Dendr } \gamma$  are the underlying operads of the category of  $\gamma$ -polydendriform algebras, that are algebras with  $2\gamma$  operations  $\leftarrow a, \rightarrow a, a \in [\gamma]$ , satisfying some relations. Free objects in these categories involve binary trees where all edges connecting two internal nodes are labeled on  $[\gamma]$  and the computation of a product of two binary trees admits an inductive description.

We show that totally compatible dialgebras are closely related to bimodule algebras and semi-homomorphisms. More significantly, Rota-Baxter operators on totally compatible dialgebras provide a uniform framework to generalize known results that Rota-Baxter related operators give tridendriform algebras.

Dendriform dialgebras. A dendriform dialgebra  $E$  over  $K$  [9, Section 5] is a  $K$ -vector space equipped with two binary operations,  $\langle : E \otimes E \rightarrow E, \rangle : E \otimes$

$E \rightarrow E$ , such that (4.1.1a)  $(x < y) < z = x < (y < z + y > z)$ , (4.1.1b)  $(x > y) < z = x > (y < z)$ , (4.1.1c)  $(x < y + x > y) > z = x > (y > z)$  for all  $x, y, z \in E$ . Dendriform dialgebras are the operadic duals of dialgebras.

In his paper about arithmetree, Loday introduced planar binary trees in homology theory related to dialgebras and constructed addition and multiplication operations on the set of planar binary rooted trees giving rise to a new kind of arithmetic theory. This theory has also been extended to all planar rooted trees.
