And so...as a VERY GENERAL rule of thumb: 50W amps or greater are better for large-venue performances. 40W amps or less are better for practice, studio, and small to mid-size venues. And if you want an exact number to start with...20W or 30W will most likely give you maximum versatility in each of these settings.

## **Electric Guitar Amps: The Ultimate Guide for Stage, Studio ...**

Due to the nature of the electronics, a 10-watt tube amp will likely keep up with a blues or rock drummer just fine. However, a solid state amp that's 10 watts will go completely unheard. Tube amps are simply louder than their solid state counterparts, so when buying an amp don't just focus on the wattage but also the construction of it.

The basic rule is, your amp head's power output, usually indicated by watts, shouldn't exceed the wattage rating of your speakers. If my amp is rated at 200 watts, and I was powering a 100-watt speaker, then the speakers would probably blow after turning the volume up past 5 or 6 because amps use more of their power at higher volume.

## **Understanding Guitar Amps Watts, Ohms, and Speaker Wiring ...**

Simply put, a higher wattage tube amp is louder, but because of reasons a bit too complex to go into here, the perceived volume of a tube amp at the same wattage as a solid-state amp will be louder. This is why you can probably gig with a 20W tube head for smaller shows, whereas a 20W solid-state won't cut it.

...

**Power and Speaker Size.** The power rating and size of speaker you choose for your amp will depend to some degree on application and price. Practice amps are usually solid state or modeling combo units featuring low power (10-30 watts) and small (8" or 10") speakers, although there are some small tube amps to be found.

In the 1940s, '50s, and early '60s, guitar amps rarely carried speakers rated higher than 15 to 30 watts (although we'll look at a few exceptions below). Indeed, early guitar amps rarely put out more than the higher figure, until the arrival of the 80-watt Fender Twin of the late 1950s, and a few others.

The 20-watt amp is double the power of the 10-watt amp, but doubling the power only translates to an increase of 3 dB SPL. Remember, in order to sound "twice as loud," you need an increase of 10dB, so while a 20W amplifier will sound noticeably louder than a 10W amp, it will not sound twice as loud.

## **Understanding Wattage, Speaker Efficiency, and Amplifier ...**

A very important point to note is that wattage is not measured in an absolute scale. Hence, a 5-watt amplifier is louder than a 25-watt amplifier. So, always remember, when it comes to wattage, the lesser the value, the louder the sound. Before you buy an electric guitar amplifier, know what you want to use it for.
