The current chapter gives an overview on sampling methods applied in the scope of forest inventories, describes their general approaches and estimation procedures, and discusses advantages and disadvantages of the individual designs. Fixed area plots and point sampling for the selection of trees on sampling units are presented.

### Sampling in Forest Inventories | SpringerLink

Cluster sampling reduces travel between plots while providing a sufficient number of plots. The optimal shape and size may be addressed using sampling simulation and prior information, although circular plots are often used in forest inventories.

Example of hardware equipment for forest inventories: GPS and laser rangefinder for mapping connected to a field rugged computer. A timber cruise is a sample measurement of a stand used to estimate the amount of standing timber that the forest contains. These measurements are collected at sample locations called plots, quadrants, or strips.

### Forest inventory - Wikipedia

Due to cost and time constraints inventories are generally carried out using sampling techniques. The general principle of sampling is to select a subset from a population and draw inferences from the sample to the entire population. The selection of the most appropriate

ELEMENTARY FOREST SAMPLING This is a statistical cookbook for foresters. It presents some sampling methods that have been found useful in forestry.

### Elementry Forest Sampling - US Forest Service

Forest inventory information obtained from the entire forest is called complete or 100% inventory. In contrast, when the measurements are taken from a representative sample of the forest it is a sampling inventory. The information requirements regarding the forest resource are as manifold as are the interests in forest as an ecosystem.
